

Jordan Hotel Dataset Research Report

Scope and deliverables

I compiled a structured dataset of **50 hotels in Jordan** and prepared two downloadable tabular files plus a static location plot based on the subset of hotels for which I could directly verify latitude/longitude from public source material. The files are:

- [Download the CSV table](#)
- [Download the Excel-ready workbook](#)
- [Download the map image of verified hotel points](#)

The table covers a representative mix across **Amman, the Dead Sea/Sweimeh, Aqaba, Petra/Wadi Musa, Madaba, Jerash, Wadi Rum, and Irbid**. Each row includes the requested core fields: hotel name, city/town, full address, GPS coordinates where directly verified, official website URL, phone, email where public, star rating, room count where public, selected amenities, a price field or rate note, short description, an image field, image attribution, and source URLs. The table uses **“unspecified”** wherever I could not confirm a detail from the prioritized public source stack with sufficient confidence.

Source hierarchy and method

The research followed a strict source hierarchy. I prioritized **official hotel websites** and **official Jordan/Visit Jordan pages** first for identity, address, phone, official descriptions, and venue/contact details. That official layer was especially useful for Four Seasons Amman, Grand Hyatt Amman, InterContinental Amman, Hyatt Regency Aqaba Ayla Resort, Le Royal Hotel Amman, Petra Marriott Hotel, Mosaic City Hotel, and others. ¹

I then used **Booking.com, Expedia, TripAdvisor, Hilton, Marriott, Hyatt, Accor, IHG, and Travel Weekly / meetings-and-conventions trade listings** to fill gaps in room counts, common star classifications, amenity summaries, and price snapshots. Examples include Signia by Hilton Amman’s room count and rate band, Amman Marriott’s rate band, Grand Hyatt Amman’s room count, Petra Moon Luxury Hotel’s proximity and review signals, and Mariam Hotel’s rate example. ²

For coordinates, I only retained values when a source surfaced a specific pair directly, such as **W Amman, Grand Hyatt Amman, Kempinski Hotel Ishtar Dead Sea, InterContinental Aqaba, The Ritz-Carlton, Amman**, and several Accor properties whose official or map-linked location pages exposed explicit GPS values. Where a reliable point was not surfaced directly, I did **not** estimate from the street address; instead, the file marks the coordinates as unspecified. ³

A practical note on the image field: official hotel pages often load images dynamically or behind unstable asset URLs, so in many rows the “image URL” is a **stable official gallery or overview page URL** rather than a directly downloadable image file URL. That preserves a durable, reputable image reference without inventing unsupported asset links.

Executive summary

The compiled dataset shows a clear concentration of Jordan's highest-profile hotels in **Amman, the Dead Sea, Aqaba, and Petra/Wadi Musa**, which is exactly where the strongest published metadata also exists. International luxury brands dominate the most complete records, because those properties tend to publish full contact details, venue specs, and standardized amenity and room information. Official destination and meetings pages from Jordan also disproportionately cover higher-end and conference-capable properties, which further improves data quality for that segment. ⁴

The strongest candidates for a **top-ten list by rating/reputation** in this sample are the following, based on a blend of luxury brand strength, visibility across official and major OTA/travel platforms, and strong placement in Jordan's core demand corridors:

- **The Ritz-Carlton, Amman** — flagship 5-star luxury positioning in Amman's 5th Circle. ⁵
- **The St. Regis Amman** — premium 5-star brand with substantial room stock and business-event visibility. ⁶
- **Four Seasons Hotel Amman** — long-established top-tier luxury hotel with official venue and contact depth. ⁷
- **W Amman** — high-profile lifestyle luxury hotel in Abdali with strong design-led positioning. ⁸
- **Kempinski Hotel Ishtar Dead Sea** — one of the Dead Sea's best-known luxury beachfront resorts with a large room inventory and extensive leisure infrastructure. ⁹
- **Hyatt Regency Aqaba Ayla Resort** — major premium resort in Ayla with a large room base and strong amenity set. ¹⁰
- **Al Manara, a Luxury Collection Hotel, Saraya Aqaba** — one of Aqaba's most prestigious luxury coastal stays under Marriott's Luxury Collection. ¹¹
- **Mövenpick Resort Petra** — one of Petra's signature luxury properties, notable for its entrance-adjacent location and established reputation. ¹²
- **Hilton Dead Sea Resort & Spa** — high-visibility Dead Sea leisure resort with strong spa-and-beach profile. ¹³
- **Petra Moon Luxury Hotel** — exceptional location by Petra's visitor center and consistently strong review signals on travel platforms. ¹⁴

Three practical findings stand out from the dataset. First, **luxury and upper-upscale properties are far better documented** than independent midscale hotels, especially in Amman, Dead Sea, Aqaba, and Petra. Second, **nightly rate data is inherently volatile** because official booking engines and OTA pages are date-dependent and often quote based on one specific stay window; examples include Amman Marriott, Signia by Hilton Amman, Opal Hotel Amman, Mariam Hotel, and Sedrah Hotel. Third, **exact public geocodes and public email addresses are the weakest fields overall** outside the luxury/conference segment. ¹⁵

Analytical observations from the dataset

Amman is the most data-rich part of the sample and the most brand-dense urban market. The city's hotel inventory includes strong representation from Marriott, Hilton, Hyatt, Four Seasons, IHG, Rotana, and independent premium operators. The addresses and venue metadata point to a heavy clustering around **5th Circle, Jabal Amman, Shmeisani, and Abdali**, which aligns with the capital's diplomatic, business, and premium leisure geography. ¹⁶

The Dead Sea cluster is distinctly resort-led rather than city-led. Kempinski, Marriott, Hilton, Mövenpick, Crowne Plaza, Holiday Inn, Ramada, and Dead Sea Spa all emphasize private beach access, spa/wellness, pools, and destination-style leisure facilities more than urban walkability. This is also the segment where day-pass and spa language is common in destination/travel coverage, reinforcing that the Dead Sea market behaves more like a self-contained resort corridor than a conventional hotel market. ¹⁷

Aqaba splits into two submarkets: **central Aqaba beachfront/city hotels** and **Tala Bay / Ayla destination resorts**. InterContinental Aqaba, Kempinski Aqaba, Mövenpick Resort & Residences Aqaba, DoubleTree Aqaba, and Oryx Hotel Aqaba sit closer to the traditional city/beach zone, while Hyatt Regency Aqaba Ayla, Al Manara Saraya Aqaba, and Mövenpick Tala Bay are embedded in larger resort/master-planned environments. That distinction matters if the dataset is later used for segmentation, pricing models, or travel-planning applications. ¹⁸

Petra/Wadi Musa is the most location-sensitive market in the file. Hotels that are physically near the visitor center or main entrance command disproportionate attention: Mövenpick Resort Petra, Petra Guest House, Petra Moon Luxury Hotel, and La Maison Hotel all lean heavily on entrance proximity, while Petra Marriott and Hayat Zaman compete more on setting, views, or resort ambience rather than immediate gate access. That means a dataset user could reasonably create a separate “entrance-adjacent Petra” segment for itinerary or pricing analysis. ¹⁹

Research workflow

The process above is intentionally conservative. Whenever an address, rate, room count, email, or coordinate appeared inconsistent or was only indirectly inferable, I preferred to leave the field as **unspecified** rather than convert a probable guess into a false fact.

Data quality, gaps, and limitations

The dataset is strongest for **identity, city, address, official website, phone, star rating, and broad amenities**. Those fields are well supported by official pages and major OTAs across the upper-upscale and luxury segment. It is materially weaker for **public email addresses, room counts for independents, stable image-file URLs, and exact GPS coordinates** for properties that do not expose them publicly in a parseable way. Examples of strong structured publication include Mosaic City Hotel, Grand Hotel Madaba, Le Royal Hotel Amman, Petra Marriott Hotel, and Signia by Hilton Amman; examples of weaker publication are smaller Petra, Jerash, and Wadi Rum properties, which often surface only partial data through OTA snapshots or social pages. ²⁰

Rate fields should be treated as **research-time snapshots**, not enduring price truths. Travel platforms explicitly vary price by stay date, room type, and availability. That is visible in examples such as Opal Hotel Amman, Mariam Hotel, Sedrah Hotel, Seven Days Hotel, and Petra Moon Luxury Hotel, where quoted rates are clearly tied to a particular search context. ²¹

The static map image plots only the **subset of hotels with directly verified coordinate pairs**. That is a methodological choice, not a technical omission: I did not backfill missing geocodes from approximate neighborhood centroids because doing so would reduce analytical trust. The downloadable table therefore preserves the distinction between **verified coordinates** and **unspecified coordinates** rather than pretending to offer full precision where the public evidence was uneven.

Open questions and limitations

Two limitations remain important if this dataset will be used operationally. The first is that some “image URL” values are stable official **gallery or overview pages** rather than direct image-file links, because many hotel sites serve images through dynamic or unstable assets. The second is that a minority of properties — especially smaller independent hotels and desert camps — do not publish enough structured metadata to support a complete record under a rigorous source standard. In those cases, the table remains useful, but it should be interpreted as a **best-evidence public-web compilation**, not as a substitute for direct property outreach.
